

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application.

1. (currently amended) An inflatable support for providing pressure relief, the inflatable support comprising at least one undivided inflatable transverse cell extending transversely of the support, each at least one transverse cell having ~~outermost~~ opposite ends and within each said ~~outermost~~ opposite end at least one internal cell, each at least one internal cell at a higher pressure than the transverse cell and having a lower height than the transverse cell, such that the whole of an upper surface of the transverse cell provides pressure relief.
2. (previously presented) The inflatable support of claim 1, comprising a plurality of transverse cells, inflated and deflated alternately.
3. (previously presented) The inflatable support of claim 1, wherein the at least one internal cell is constantly inflated.
4. (previously presented) The inflatable support of claim 1, wherein the at least one internal cell is chamfered at least one internal edge.
5. (previously presented) An inflatable support comprising at least one inflatable transverse cell extending transversely of the support, the at least one transverse cell having outermost opposite ends and within each said outermost opposite end at least one internal cell at a higher pressure than the transverse cell, the at least one internal cell having a lower height than the transverse cell and filled with foam material.
6. (currently amended) An inflatable support comprising at least one undivided inflatable transverse cell extending transversely of the support, the at least one transverse cell having ~~outermost~~ opposite ends and within each said ~~outermost~~ opposite end at least one

internal cell at a higher pressure than the transverse cell, the least one internal cell at each opposite end of the transverse cell having a lower height than the transverse cell and connected by a common manifold and inflated jointly by that manifold.

7. (previously presented) An inflatable support comprising at least one inflatable transverse cell extending transversely of the support, the at least one transverse cell having outermost opposite ends and within each said outermost opposite end at least one internal cell at a higher pressure than the transverse cell, the least one internal cell at each opposite end of the transverse cell having a lower height than the transverse cell and connected by a common manifold and inflated jointly by that manifold, wherein the manifold is of foam.

8. (new) An inflatable support for providing pressure relief, the inflatable support comprising at least two sets of cells extending transversely of the support, the sets alternately inflatable and deflatable to alternately provide pressure relief and support for a patient supported on the support, each at least one transverse cell extending across a center of a width of the support and having outermost opposite ends, and within each said outermost opposite end at least one internal cell, each at least one internal cell at a higher pressure than the transverse cell and having a lower height than the transverse cell.
